

Instructions for Providing an Access Token to a Third-Party Inventory Integrator

Your third-party integrator will contact you when they are ready to connect to your NMS2S location(s). At that time, they will need an access token for each location they are integrating.

If You Already Have an Access Token

If you operate a retail business, you previously generated an access token for your POS provider.

- If you still have a copy of that token, you may provide it directly to your third-party inventory integrator.
- No additional action is required.

If You Do Not Have the Access Token

If you no longer have a copy of the token that was provided to your POS provider, you can generate a new token and provide it to your third-party integrator.

Important: Do not revoke the token currently being used by your POS provider, as doing so may interrupt your POS integration. Lost the old token? Don't revoke it. Create another one.

How to Generate a New Access Token

1. Log in to NMS2S using an account with Administrator permissions.
2. Navigate to Locations.
3. Click Create Token.
4. Copy the token when it is displayed.
5. Provide the token to your third-party integrator.

Important

Save a copy of the token in a secure location when it is created. You will not be able to view the token again later. If you lose the token, you may need to generate a new one.

You can have up to three active access tokens for each location. Creating a new token will not disable any existing tokens.

Organizations with Multiple Locations

If your organization operates multiple locations, you will need to generate a separate access token for each location requested by the third-party integrator. Provide each token to the appropriate integrator for the location being connected.
